PROFILE

After finishing my education with a PhD in Chemistry I worked as a Quality Manager in industry before my general curiosity about nature and my specific interest for nature's catalysts (enzymes) brought me back to research and academia. I do research at the interface of many disciplines including Organic Chemistry, where I had my initial training, but also Catalysis, Molecular Biology and Microbiology. In the recent years I got fascinated about using light in (bio)chemistry. My current position allows complementing my enthusiasm in research with my passion for teaching. As ongoing science-to-public project I co-host the Podcast "In the Active Site".

MAIN RESEARCH AREAS

BIOCATALYSIS

My main activities in biocatalysis focus on the following enzyme classes: ene-reductases, cytochrome P450s, carboxylate reductases, hydrolases, and several classes of (de)carboxylases. Many of these enzymes utilize carboxylic acids or derivatives as substrates.

PHOTOBIOCATALYSIS

I investigate both main applications of photons in biocatalytic reactions: (i) their use as energy source (e.g. for cofactor recycling), and (ii) their potential use to unlock novel, unprecedented reactivities.

REACTOR DESIGN

The interest in Photobiocatalysis led to the development of a well-characterized open source photobioreactor for the parallel screening of photobiocatalytic reactions under reproducible conditions.
